Title of the Project: Online Recruitment System

Name of the Project: RecruitHub

INTRODUCTION

This project has been done by the students of the **B.Tech Information Technology** program for the course of '**Database Management Systems**' with the course code **ITE1003** from Theory Slot G1 and Lab Slot L45+46.

Abstract:

In today's time the necessity of executing things is increasing rapidly and technology plays quite a vital role in day-to-day activities and this in turn made great changes in many work fields and out of them, the recruitment process is one that changed a lot of colors in their systematic approaches. The computer based recruitment system is to replace the manual operations of recruitment as it is time-taking and often chaotic. As recruitment is round an year activity involving thousands of candidates, a need has been felt to automate the process.

Problem Statement:

The pandemic has accelerated the shift to online, it has provided many opportunities and at the same time it has caused immense damage. It has affected the job sector tremendously and many people have been laid off. We want to create a platform where it is easy for the companies to put out their requirements and advertisements and for people to apply for these positions. It is aimed at serving the needs of both sides and hence making communication between them simpler.

OBJECTIVE

The main idea behind our project is to provide a platform where the process of finding jobs and employees becomes simpler. We are creating a portal where job seekers can find their dream companies and the companies in turn can find employees matching their requirements.

A database will hold all the information and details required for both the employees and the employers, hence enabling us to create an application which will ease the process of hiring and job seeking.

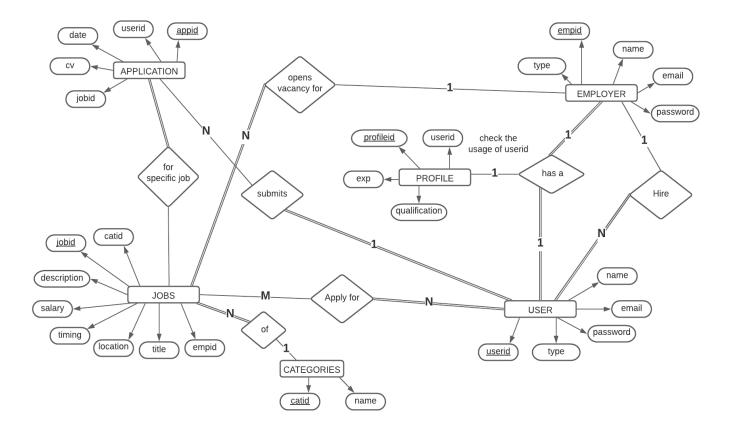

PROPOSED SYSTEM OVERVIEW

- Starting Page: Can navigate to Login / Sign Up from here. Recruits can go through offers without logging in.
- Sign Up / Login page for job seekers and companies.
- Client Side Job Seeker:
 - Finding Jobs: To surf through and register for companies.
 - Scheduling Interview: Selecting a date and time if the application gets approved.
- Client Side Company:
 - **Finding Recruits :** To surf through and send requests to suitable recruits.
 - Scheduling Interview: Selecting a date and time if the recruit accepts the hire request.

EXPECTED OUTPUT

We are expecting to create a website by the end of this project that will be connected to a database and all the information will be stored in it. Database information can be viewed into 2 parts, depending on whether the user is a job seeker or from a company.
